Abstrak

Penelitian ini bertujuan untuk melihat adanya hubungan antara religious coping dan parenting Self-efficacy pada orangtua yang memiliki anak dengan Gangguan Spektrum Autistik (GSA). Partisipan penelitian ini adalah 147 orangtua anak GSA. Religious coping diukur dengan alat ukur Brief RCOPE yang telah dibuat dan dikembangkan oleh Pargament (1998). Parenting Self-efficacy diukur dengan alat ukur subskala efficacy pada PSOC scale yang dikembangkan oleh Johnston & Mash (1989). Hasil penelitian ini menunjukkan bahwa terdapat hubungan positif dan signifikan antara religious coping positif dan parenting self-efficacy. Sementara, tidak terdapat hubungan yang signifikan antara religious coping negatif dan parenting self-efficacy.

The objective of this research is to investigate the relationship between religious coping and parenting self-efficacy in parents of children with autistic spectrum disorder. Participants of this research are 147 parents of children with autistic spectrum disorder. Religious coping was measured by measurement tools Brief RCOPE made and developed by Pargament (1998). Parenting self-efficacy was measured by measurement tools efficacy subscale of PSOC scale developed by Johnston & Mash (1989). The result indicates that there are positive and significant relations between positive religious coping and parenting self-efficacy. Meanwhile, there are no significant relations between negative religious coping and parenting self-efficacy.
