Abstrak

.....Suppose is a graph with set of vertices and set of edges where $|V|$ is the number of vertices and $|E|$ is the number of edges on G. A total vertex irregularity strength of graph G or TVS(G) are the smallest value of Δ such that Δ is a function from $V(G)$ to $\{1, 2, \dots, |E|\}$ such that the weight of every two distinct vertices are different, where the weight of vertex v is $\sum_{e \ni v} w(e)$. In this construction, we will use labels x_1, x_2, \dots, x_n for vertices and e_1, e_2, \dots, e_m for edges.

of total-k labelling vertex irregularity strength of graf 1,2,3 is given with 1,2,3 ⌈ ⌉.
