

Non-invasive assesment and evaluation of portal hypertension in patients with liver cirrhosis

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20296295&lokasi=lokal>

Abstrak

Ultrasonography examination is an one of examination that can be used to see the abnormality of portal vein system. The technology of ultrasonography examination has further developed especially after using of Doppler ultrasonography which could portray haemodynamic changes from portal vein in liver cirrhosis patient. From this examination we also could predict bleeding.
