Abstract

Therapeutic play is very important to reduce the effects of hospitalization and the continuity of growth and development of children whom cared at hospital. Unfortunately, therapeutic play has not been implemented optimally. Nurses' knowledge about therapeutic play will affect their behavior in the implementation of therapeutic play. The research objective was to determine nurses' knowledge level about therapeutic play in the children ward RSAB Harapan Kita. This research used descriptive design with cluster random sampling techniques. The respondents were 74 nurses who work in inpatient ward. Data was collected using questionnaires, and was analysis using univariate analysis. The results obtained as much as 73% of nurses had sufficient levels of knowledge about therapeutic play. It is recommended that hospital establishes policies that support the improvement of nursing knowledge about therapeutic play.
