## Abstrak

Program kesehatan yang diharapkan ikut berperan menurunkan AKI melalui penyelenggaraan kelas ibu hamil. Setelah dilakukan intervensi program kelas ibu hamil, belum diperoleh hasil yang signifikan terhadap pencapaian pertolongan persalinan oleh tenaga kesehatan di wilayah Puskesmas Bruno tahun 2012. Cakupan persalinan oleh tenaga kesehatan baru mencapai 60%. Desain penelitian ini adalah cross sectional. Jumlah sampel 104 pada ibu yang pernah mengikuti kelas ibu hamil dan telah melahirkan pada tahun 2011. Hasil penelitian diperoleh hasil 54 (51,9%) bersalin dengan tenaga kesehatan. Variabel lain yang memiliki hubungan signifikan dengan perilaku pemilihan penolong persalinan adalah pengetahuan, peranan petugas kesehatan dan dukungan kelompok kelas ibu hamil. Saran untuk puskesmas meningkatkan kualitas pelayanan kelas ibu hamil.

.....Health program contributes to decrease Maternal Mortality Rate is by carrying expectant class. Having had an intervention about expectant class program, it had not been obtained significant result to achievement of labor support by health officer in working area of Public Health Center Bruno 2012 where in support achievement by health officer was just 60% target determined projected 95%. The Study design is cross sectional, with number of samples are 104 expectants that ever followed expectant class and had given birth in 2011.

Study result to 104 respondents shows that it obtained 54 (51.9%) choosing health officer as their labor support. Another variables had significant correlation to behavior of choice of labor support are knowledge, health officer role, and support to expectant class. Suggestions for improving the quality of health centers pregnancy class.
