Abstrak

Chlorella vulgaris Buitenzorg cultivation using three bubble column photo bioreactors arranged in series with a volume of 200 mL for 130 hours shows an increase of biomass production of Chlorella vulgaris Buitenzorg up to 1.20 times and a decrease of the ability of CO₂ fixation compared to single reactor at a periodic sun illumination cycle. The operation conditions on cultivation are as following: T, 29.0oC; P, 1 atm.; UG, 2.40 m/h; CO₂, 10%; Benneck medium; and illumination source by Phillip Halogen Lamp 20W /12V/ 50Hz. Other research parameters such as microbial carbon dioxide transferred rate (q_{co2}), CO₂ transferred rate (CTR), energy consumption for cellular formation (Ex), and cultural bicarbonate species concentration [HCO₃] also give better results on series of reactor.
