ABSTRAK

The purpose of this study is to examine the information system (IS) success of the accounting software based on the user perception. The model used to examine the IS success is the modified IS success model of Seddon (1997). The model employed in this study is applied on data collected through 204 questionnaires distributed to the users of accounting software who work at the variety of companies in Indonesia. In examining the model, we employ the Structural Equation Model (SEM) with the use of LISREL 8.72 software. The results of the study show that system quality significantly affects the perceived usefulness and the user satisfaction. Furthermore, the results show that information quality significantly affects the perceived usefulness and user satisfaction. On the other hand, the study finds that user satisfaction does not affect the system use.
