## Abstrak

Kanker merupakan suatu kondisi dimana sel telah kehilangan pengendalian dan pertumbuhan normal. Mastektomi tidak hanya meninggalkan bekas secara fisik, namun juga terhadap psikologis pasien yaitu menurunkan perasaan bangga sebagai wanita. Penelitian deskriptif ini bertujuan untuk mengetahui gambaran konsep diri pasien post masektomi yang melibatkan 85 responden dengan teknik simple random sampling. Hasil analisis univariat menjelaskan bahwa mayoritas responden post masektomi memiliki konsep diri yang positif (55,3%). Pasien post masektomi perlu diberikan konseling serta perilaku caring, sehingga pasien dapat menerima perubahan dalam dirinya dengan konsep diri yang positif.

.....Cancer is a condition in which the cells have lost control and normal growth. Mastectomy scars not only impact physically, but also reduced the patients psychological sense of pride as a women. The purpose of this descriptive study to describe the self-concept of postmastectomy patients involving 85 respondents with simple random sampling technique. The results of univariate analysis explain the majority mastectomy patients need to be counseled and caring behavior, so that patients can receive the changed in him with a positive self-concept;Cancer is a condition in which the cells have lost control and normal growth.
