**Abstrak**

Penelitian ini membahas persepsi risiko para pekerja bagian satwa terhadap pajanan bahaya biologi di Kebun Binatang Bandung tahun 2014. Penelitian ini menggunakan jenis penelitian cross sectional dengan pendekatan kuantitatif dan kualitatif. Hasil penelitian menunjukkan bahwa persepsi risiko para pekerja bagian satwa di Kebun Binatang Bandung terhadap pajanan bahaya biologi masih kurang baik. Pengendalian yang telah dilakukan dalam menghadapi pajanan bahaya biologi di Kebun Binatang menjadi faktor dominan karena memiliki nilai bobot rata-rata yang paling rendah. Oleh karena itu, peneliti menyarankan beberapa program pengendalian berdasarkan hierarchy of control untuk menghadapi pajanan bahaya biologi yang berasal dari satwa di Kebun Binatang Bandung.

.....

This study discusses the risk perception of wildlife workers against biological hazards exposure at Bandung Zoological Park in 2014. This research uses cross sectional study with quantitative and qualitative approaches. The results showed that the risk perception of wildlife workers are poor. Control over the risk from biological hazard is the dominant factor from independent variable influences risk perception of wildlife workers because it is the lowest weight scale average between the other independent variable. Researcher suggest several control programs based on hierarchy of control to against biological hazard exposure from animals at Bandung Zoological Park.
