## Abstrak

Model BaFe<sub>12</sub>O<sub>19</sub> telah dikembangkan menggunakan pendekatan Mean Field pada Hamiltonian Heisenberg. Parameter exchange interaction dihitung dengan memanfaatkan informasi posisi-posisi Fe<sup>3+</sup> dan nilai suhu Curie Barium hexaferrite. Model ini memberikan nilai magnetisasi saturasi sebesar 79 emu/gram dan koersivitas 0.7 Tesla untuk BaFe<sub>12</sub>O<sub>19</sub> pada suhu kamar. BaFe<sub>12</sub>xMnxO<sub>19</sub> (x=0,1,2,4), BaFe<sub>12</sub>xTixO<sub>19</sub> (x=0,1,2), BaFe<sub>12</sub>2xMnxTixO<sub>19</sub> (x=0,1,2) mengalami penurunan nilai magnetisasi saturasi, remanen, dan koersivitas seiring meningkatnya konsentrasi Mn/Ti.

*A model of BaFe<sub>12</sub>O<sub>19</sub> has been developed based on Heisenberg Hamiltonian within Mean Field approximation. The exchange interaction parameter was calculated using the information of Curie temperature and positions of Fe<sup>3+</sup> ions in Barium hexaferrite. This model at room temperature gives a saturation magnetization value about 79 emu/gram and coercivity about 0.7 Tesla for BaFe<sub>12</sub>O<sub>19</sub>. BaFe<sub>12</sub>xMnxO<sub>19</sub> (x=0,1,2,4), BaFe<sub>12</sub>xTixO<sub>19</sub> (x=0,1,2), BaFe<sub>12</sub>2xMnxTixO<sub>19</sub> (x=0,1,2) show a decreasing trend in saturation magnetization, remanence, and coercivity with increasing x value.*
