Abstrak

This thesis presents an impressive summary of the potential to use passive seismic methods to monitor the sequestration of anthropogenic CO₂ in geologic reservoirs. The data come from the Weyburn-Midale project, which is currently the largest Carbon Capture and Storage (CCS) project in the world. James Verdon's results show how passive seismic monitoring can be used as an early warning system for fault reactivation and top seal failure, which may lead to the escape of CO₂ at the surface.
