

Remote sensing techniques for land use mapping of Bolango sub river basin

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20408710&lokasi=lokal>

Abstrak

Land use mapping can be defined as a mapping activity of land cover with cropping management and erosion control practice factors. The activity can be carried out by an application of remote sensing techniques, either air photos or Landsat images to gain land cover information. Cropping management and erosion control practice factors are derived from tables produced with cooperative activity in the field. Information on land cover resulting from remote sensing interpretation still needs to be checked in the field.
