## Abstrak

### <b>ABSTRAK</b><br>

Kecemasan merupakan reaksi yang sering terjadi selama hospitalisasi, dan dapat berakibat kepada penurunan kondisi, lamanya adaptasi dan gangguan pertumbuhan dan perkembangan anak. Gangguan pertumbuhan dan perkembangan akibat kecemasan dapat diminimalkan apabila perawat memberikan intervensi yang tepat pada anak dengan kecemasan. Penelitian ini bertujuan untuk mengidentifikasi gambaran kecemasan anak prasekolah yang dirawat di bangsal berfasilitas dan tanpa fasilitas ruang bermain. Penelitian ini menggunakan metodologi deskriptif dengan pendekatan potong lintang pada 100 anak prasekolah. Pemilihan sampel menggunakan purposive sampling. Data dikumpulkan menggunakan lembar check list observasi kecemasan anak. Data dianalisis secara univariat. Hasil menunjukkan rata-rata skor kecemasan anak pada bangsal berfasilitas ruang bermain 29,70 dengan SD 6,609 sedangkan tanpa fasilitas ruang bermain 36,24 dengan SD 6,760. Kesimpulan penelitian ini adalah rata-rata skor kecemasan anak di bangsal berfasilitas ruang bermain lebih rendah daripada yang tidak mempunyai fasilitas ruang bermain. Hasil penelitian ini merekomendasikan bahwa perlunya fasilitas ruang bermain di bangsal perawatan anak untuk menurunkan kecemasan hospitalisasi.
