<b>ABSTRACT</b><br>

Adolescents are at risk to risky sexual behavior. Risky sexual behavior may lead to the feelings of guilt, depression, dropping out of school, unwanted pregnancy and abortion. The purpose of this research was to identify the relationships between affective function of families and risky sexual behavior in adolescents. This study used cross sectional design. The number of 108 respondents were selected using simple random sampling. The results showed that there was a significant relationship between family affective functions and sexual risk behavior in adolescents ( $p \text{ value} < 0,05$ ). This study recommends parents to stengthen their family fuction through providing physical affective, improving family engagement, and enhancing assertive communication in living the norm and creating the family expectation, that eventually would protect adolescent from risky sexual behaviour., Adolescents are at risk to risky sexual behavior.
