[ABSTRAK

Masalah kesehatan masyarakat menjadi perhatian utama, khususnya bagi pelayanan kesehatan. Salah satu dari masalah kesehatan yang muncul adalah penyakit infeksi seperti tetanus. Miliaria merupakan salah satu manifestasi klinis yang disebabkan oleh bakteri tetanus. Miliaria terjadi akibat dari produksi keringat yang berlebih, sehingga menyebabkan tersumbatnya kelenjar keringat pada kulit. Studi kasus yang dilakukan bertujuan untuk mengidentifikasi keefektifan virgin coconut oil (VCO) dalam mengatasi miliaria pada pasien tetanus. Metode yang digunakan adalah observasi sebelum dan setelah pemberian. Setelah 6 hari perawatan dengan VCO menunjukkan penurunan pada jumlah miliaria. VCO terbukti efektif untuk menurunkan miliaria. Penerapan VCO pada miliaria dari penyakit lain dan menganalisis hasil pada pasien yang berbeda penting untuk aplikasi perawatan selanjutnya.

ABSTRACT

Public health problem is one of the major concerns, especially for health care provider. One of the health problems that arise are infectious diseases such as tetanus. Miliaria is one of the clinical manifestations caused by the tetanus bacteria. Miliaria occur as a result of excessive sweat production, causing blockage of sweat glands in the skin. The case study was carried out aiming to identify the effectiveness of virgin coconut oil (VCO) in overcoming miliaria tetanus patients. The method used was observation before and after administration. The result after 6 days of treatment with VCO showed decrease in the number of miliaria. VCO was proven effective for lowering miliary. The used of VCO in miliaria caused by other diseases and analyzed the result is important to increase health care for patients. ;Public health problem is one of the major concerns, especially for health care provider.
