

Penanggulangan Lahan Pasca Pekerjaan Engineering :

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20425419&lokasi=lokal>

Abstrak

The collide between engineering developers and environmental developers has been a dilemma for a long time. Environmentalists protest on the developing of roads across forest area or conservation area due to their lack of respect on environmental aspects. Environment became the victims of concrete structures and asphalt construction cross along the line, consume the areas and green hills existed. Those actions cause new threats on the area; like erosion and landslide, while the preventive actions haven't done yet. Sad as it is, but it happen as a fact.

Everyone did nothing but watching while it happen, but if we willing to be wiser as the actors

of the development itself, this issue can be prevented before the development concept was

proposed. Researches on environmental impact need to be done earlier so that the development concepts will refer to environmental and sustainable principles instead of

environmental destruction concepts. "Natural and Engineering in Harmony" is something that we should establish , without having to give a higher value on one of them, but more on giving the ideal value to both. So that the harmony of nature and engineering can be accomplished and each aspect could give more positive values to the natural and sustainable development.
