

Manifestasi behçet disease yang parah dan komplikasi perawatannya dalam rongga mulut (laporan kasus)

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20428995&lokasi=lokal>

Abstrak

Behçet's Disease (BD) is a multisystem inflammatory disorder characterized by recurrent oral-genital ulcers, ocular inflammation and frequently involves the joints, skin, central nervous system and gastrointestinal tract. We reported a case of severe BD in 30 years old male patient with oral-genital ulcerations and ocular involvement. He had suffered from the disease since twelve years ago and ocular involvement has lead to blindness of the right eye. Eye drop treatment for eight years, was suspected to cause lichenoid lesion on the buccal mucosa. Management of this patient included the application of topical steroid, 1 % povidone iodine and oral hygiene promotion. We concluded that disease condition, poor oral hygiene, disability and less compliance of the patient could slowed the acceleration of lesions healing. Elimination local exacerbating factors and a good coordination between dentist-patient and among medical team work are required to achieve the optimal recovery and to minimize complication of its treatment in the oral cavity.
