Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20430529&lokasi=lokal>

Abstrak

Caring merupakan bentuk perilaku dalam keperawatan. Caring merupakan aspek penting yang harus dimiliki oleh perawat dalam praktik keperawatan. Namun fakta di lapangan menunjukkan bahwa perilaku caring beberapa perawat disebagian besar rumah sakit masih belum sesuai harapan. Beberapa penelitian tentang perilaku caring perawat dibereberapa rumah sakit menunjukkan bahwa sebagian perawat memiliki perilaku caring rendah.

Penelitian ini bertujuan untuk mengetahui gambaran perilaku caring perawat di ruang rawat inap lantai 4 gedung A RSUPN Dr. Cipto Mangunkusumo Jakarta menurut penilaian perawat sendiri.

Penelitian ini merupakan penelitian kuantitatif dengan jenis penelitian deskriptif. Pengambilan data dilakukan selama kurang lebih 10 hari dengan jumlah responden sebanyak 60 orang perawat dengan menggunakan teknik total sampling. Pengambilan data menggunakan kuesioner CNPI (Caring Nurse Patient Interaction Scale) yang sudah diterjemahkan.

Hasil analisis perilaku caring berdasarkan 10 faktor karatif didapatkan bahwa perawat sudah menerapkan perilaku caring pada faktor karatif 1 sampai dengan karatif 9 dengan persentase diatas 80%, kecuali karatif 10 baru mencapai 70%.

Saran bagi penelitian selanjutnya agar dapat meneliti lebih dalam tentang perilaku caring perawat tidak hanya menurut penilaian perawat sendiri, tetapi berdasarkan penilaian pasien atau melalui observasi.

<hr><i>Caring is a form of behavior in nursing. Caring is an important aspect that must be possessed by nurses in nursing practice. But the facts on the daily practice showed that some nurses caring behavior in most hospitals were still not as expected. Several studies of the behavior of caring nurses in several hospitals indicated that some nurses had low caring behavior.

This study aims to describe the behavior of caring nurses in the inpatient unit 4th floor of building A Cipto Mangunkusumo National Referral Hospital according to its own assessment nurse.

This study was a quantitative descriptive research. Data collection was performed for approximately 10 days with the number of respondents as many as 60 nurses using total sampling technique. Retrieving data using questionnaires CNPI (Caring Nurse Patient Interaction Scale) which had been translated.

The results of the analysis is based on 10 caratif factors of caring behavior found that nurses had applied caring behavior on caratif factors 1 through 9 with percentages above 80%, except karatif 10 had reached 70%.

Suggestions for further research is to study the nurse caring behavior not only based on the judgment of the nurses themselves, but also based on the assessment of the patients or through observation.</i>
