Abstrak

The purpose of this study was to evaluate relapse on mandibular anterior teeth after orthodontic treatment using irregularity index. In total 44 subjects were included, 10 men and 34 woman, aged 15 to 37 years. All patients were Hawley retainers. The results showed that there were statistically significant differences between the values of irregularity index at the completion of orthodontic therapy (mean ii T2 = 0.57 mm) and in the retention periods (mean ii T3 = 2.36 mm). The changes of mandibular anterior teeth irregularity were in the minimal category for the majority of cases.
