Abstrak

This study argues that the extensive use of Information and Communications Technology (ICT) by the Association of Southeast Asian Nations (ASEAN) would: ((1) enhance policy coordination within the intergovernmental organization; (2) promote inclusive regionalism by providing new avenues for broader stakeholder participation in regional affairs; (3) help develop a stronger regional identity, particularly among the young; and (4) improve "network management" or coordination of the collaborative activities of the member states. But this study is not merely about making ASEAN more effective.
