Abstrak

ABSTRAK

Penelitian ini bertujuan untuk mengetahui parental career-related behaviors seperti, tingkah laku mendukung, ikut campur, dan kurang terlibat sebagai prediktor yang dikategorikan dari ibu dan ayah terhadap adaptabilitas karier pada mahasiswa tingkat akhir. Pengukuran parental career-related behaviors menggunakan parental career-related behaviors inventory Dietrich Kracke, 2009, sementara adaptabilitas karier menggunakan Career Adapt-Abilities Scale CAAS versi internasional Savickas Porfeli, 2012 yang telah diadaptasi ke dalam bahasa Indonesia. Penelitian dilakukan kepada 365 mahasiswa tingkat akhir di Indonesia. Hasil analisis regresi berganda menunjukkan bahwa tingkah laku ibu yang mendukung, ikut campur, dan kurang terlibat dalam karier anak tidak memprediksi secara signifikan adaptabilitas karier pada mahasiswa tingkat akhir, $F_{3, 361} = 1,868, p > 0,05$. Sementara itu, ketiga tingkah laku ayah juga tidak memprediksi secara signifikan adaptabilitas karier, $F_{3, 361} = 1,556, p > 0,05$.

ABSTRACT

This research aimed to examine parental career related behaviors i.e. support, interference, and lack of engagement categorized from mother or father as predictors of career adaptability i.e. career concern, control, curiosity, and confidence in Indonesian undergraduate students. Parental career related behaviors are measured by parental career related behaviors inventory Dietrich Kracke, 2009 and career adaptability is measured by International version of Career Adapt Abilities Scale CAAS Savickas Porfeli, 2012 that have been adapted to Indonesian. Offline and online questionnaire was distributed to 365 undergraduate students. Based on multiple regression analysis, the result showed that maternal career related behaviors not significantly predicted career adaptability on final year undergraduate student, $F_{3, 361} = 1,868, p > 0,05$. In addition, paternal career related behaviors also not significantly predicted career adaptability, $F_{3, 361} = 1,556, p > 0,05$.
