Abstrak

Halusinasi adalah salah satu gejala positif yang terbanyak dari skizofrenia. Tindakan keperawatan spiritual pada klien halusinasi belum menjadi standar asuhan keperawatan di rumah sakit jiwa. Kesejahteraan spiritual pada klien halusinasi belum pernah diukur dan diteliti. Penelitian ini bertujuan mengidentifikasi hubungan kesejahteraan spiritual dengan gejala halusinasi pada klien dengan skizofrenia. Desain penelitian ini adalah cross-sectional. Sampel penelitian berjumlah 90 klien, yang dilakukan dengan metode total sampling. Instrumen yang digunakan adalah The Spiritual Well-Being Scale SWBS dan Instrumen Pengukuran Gejala Halusinasi. Analisis yang digunakan yaitu Spearman Correlation. Hasil penelitian menunjukkan adanya hubungan yang bermakna antara kesejahteraan spiritual dengan halusinasiHallucination is one of the most positive symptoms of schizophrenia. The nursing intervention of spiritual on the hallucination client has not become the standard of nursing care in mental hospital. The spiritual well being of the hallucinatory clients has never been measured and examined. This study aims to identify the relationship of spiritual well being with hallucinatory symptoms in clients with schizophrenia. The design of this study was cross sectional. The samples were 90 clients, which was done by total sampling method. This study used The Spiritual Well Being Scale SWBS and instrument of Hallucination Symptoms Measurement. Spearman correlation was used to analyze the data. The result suggested that there was a significant correlation between spiritual well being and hallucination.
