Abstrak

Intensive Care Unit ICU merupakan area tersendiri dan mempunyai stressor yang dapat menyebabkan masalah psikologis baik pada klien, bahkan juga pada keluarga klien. Sehingga membutuhkan kemampuan bertahan resiliensi dan social support yang memadai dari pelayanan kesehatan setempat, khususnya caring perawat. Penelitian dilakukan untuk melihat hubungan persepsi perilaku caring perawat yang diterima keluarga klien di ICU terhadap resiliensi keluarga. Metode Penelitian menggunakan deskriptif korelatif dengan pendekatan cross sectional pada 37 keluarga klien di ICU RSUP dr. Mohammad Hoesin Palembang. Pengumpulan data dilakukan dengan menggunakan kuesioner. Hasil uji korelasi Pearson didapatkan nilai $r = 0,504$ dengan p value $< 0,05$ sehingga mengartikan adanya hubungan yang bermakna antara persepsi keluarga klien tentang perilaku caring perawat terhadap resiliensi keluarga. Hasil penelitian menyarankan pihak rumah sakit untuk memaksimalkan peningkatan mutu terutama perawat sebagai orang yang pertama dan sering berhubungan dengan klien dan keluarga.

.....ICU is a specialized unit in hospital that having a spesific stressor which is psychological problem that perceived by clients and the family member. Therefore, they need a resilience ability and social support from nurses. This study examined the correlation between perception of nurse's caring behaviour accepted by client's family member in ICU to family resilience. The design of this study using correlational descriptive with cross sectional approach. This participants of this study consisted of 37 client's families in ICU RSUP Mohammad Hoesin Palembang. The data has been collected by a questionnaire. Pearson were used for analyzes data and result shows $r = 0,504$, p value $< 0,05$ which indicates a correlation between perception of nurse's caring behaviour accepted by client's family member in ICU to family resilience. Recommendation for hospital is to increase the quality of nursing care as a primary indicator of hospital quality service.
