ABSTRAK
 Tujuan: mendapatkan kuesioner Minnesota Living with Heart Failure MLHFQ versi bahasa Indonesia yang sah dan handal untuk digunakan di Indonesia. Metode: studi ini merupakan studi potong lintang dengan 85 subyek rerata usia 58 ± 11, pria 55 pasien gagal jantung kronik di poli kardiologi Rumah Sakit Umum Pusat Nasional Dr. Cipto Mangunkusumo Jakarta. Kesahihan diuji dengan menilai kesahihan konstruksi multitrait multimethod analysis dan kesahihan eksternal dengan membandingkan dengan kuesioner SF-36. Keandalan dinilai dengan menggunakan cronbach ?, dan intraclass coefficient correlation ICC . Hasil: MLHFQ bahasa Indonesia memiliki korelasi sedang-kuat antara domain dan item pertanyaan r 0,571-0,748, ABSTRACT
 Aim to obtain a valid and reliable Indonesian version of MLHFQ for Indonesian application. Methods This cross sectional study enroled 85 patients mean age 58 ± 11, male 55 with chronic heart failure of of cardiology clinic Ciptomangunkusumo Central Hospital Jakarta. Validity of MLHFQ was evaluated by measuring construct validity using multitrait multimethod analysis and by comparing MLHFQ with SF 36. Reliability of MLHFQ was evaluated by calculating Intraclass Correlation Coefficient ICC and by calculating cronbach to determine internal consistency Results Indonesian version of MLHFQ has moderately strong correlation item to domain correlation r 0,571-0,748, p
