Abstrak

Economic growth is the most widely used measure of economic activity. Indonesia as one of G-20 has positive economic growth while global economy downturn. Nevertheless, income inequality rises from 0,363 in 2005 to 0,394 in 2016. High growth GDP does not guarantee that all persons will benefit equally. GDP have limitation in reflection the distribution of income, social and economic progress. Therefore, it takes more than economic growth, namely techniques introduced by United Nation Development Programme (UNDP), Asian Development Bank (ADB), and World Economic Forum (WEF). The result of this study indicate that measurement of inclusive economies in Indonesia generally shows satisfactory results. If different techniques approached is applied, there is a difference in status of inclusiveness in 33 provinces and still inequalities in some variables, mainly occurs in infrastructure, education, and income. Therefore, program priority is needed to deal with that problems.
