## **Abstrak**

### **<b>ABSTRAK</b><br>**

Tujuan dari penelitian ini adalah untuk mengetahui apakah occupational self-efficacy memediasi hubungan antara dukungan sosial dan career indecision. Penelitian ini merupakan penelitian kuantitatif dan menggunakan metode korelasional dengan menggunakan sampel individu pada usia 25-44 tahun dan sedang bekerja selama minimal enam bulan N= 167). Ketiga variabel diukur menggunakan Career Decision Scale (CDS), Multidimensional Scale of Perceived Social Support (MSPSS), dan Occupational Self-Efficacy(OCCSEFF). Hasil analisis mediasi menunjukkan bahwa terdapat direct effect (= .09, .05) yang tidak signifikan dan indirect effect ( $r= -.52$ ,  $p=.05$ ) yang signifikan, dan mengindikasikan bahwa occupational self-efficacy memediasi secara penuh hubungan antara dukungan sosial dan career indecision. Dengan kata lain, dukungan sosial harus melewati occupational self-efficacy terlebih dahulu untuk memengaruhi career indecision.

### **<b>ABSTRACT</b><br>**

The purpose of this study is to determine whether occupational self-efficacy mediates the relationship between social support and career indecision. This research is a quantitative study and uses a correlational method using a sample of individuals at the age range of 25-44 years and were working for at least six months (N = 167). The three variables are measured by The Career Decision Scale (CDS), Multidimensional Scale of Perceived Social Support (MSPSS), and Occupational Self-Efficacy (OCCSEFF). The result of mediation analysis has shown the direct effect ( $r= .09$ ,  $p> .05$ ) that is not significant and a significant indirect effect ( $r= -.52$ ,  $p< .05$ ), which indicated that occupational self-efficacy fully mediates the relationship between social support and career indecision. In other words, social support must pass through occupational self-efficacy first to influence career indecision.
