## Abstrak

Isu malnutrisi menjadi isu penting kesehatan di banyak negara, terutama negara berkembang. Di antara beberapa kasus malnutrisi, stunting menjadi kasus dengan prevalensi tertinggi untuk kelompok kasus kurang gizi. Stunting berdampak terhadap banyak hal, salah satunya pendidikan, baik di jangka pendek maupun jangka panjang. Studi ini membahas dampak balita stunting tahun 2000 terhadap durasi lama sekolah pada pendidikan dasar di Indonesia. Menggunakan data cross section dengan sumber data IFLS tahun 2000 hingga 2014, analisis ini dilakukan dengan metode Regresi Linear Multivariable. Hasil penelitian menunjukkan bahwa stunting tidak signifikan mempengaruhi durasi lama sekolah. Variabel lain seperti jumlah saudara kandung dan status bekerja berpengaruh positif dan signifikan serta pendidikan ayah dan tempat tinggal berpengaruh negatif dan signifikan terhadap durasi lama sekolah.

.....Malnutrition issues is an important health issue in many countries, especially in developing countries. Among the few malnutrition cases, stunting becomes the case with the highest prevalence for undernutrition case groups. Stunting affects many things, one of them is education, both in the short and long term. This study analyses the impact of stunting children in 2000 on the duration of schooling of basic education in Indonesia. Using cross-section data with IFLS data sources from 2000 to 2014, this analysis was conducted with a Multivariable Linear regression method. The results showed that stunting did not significantly affect the duration of schooling of basic education. Other variables such as the number of siblings and working status have positive and significant effects. Also, father's education and residence have negative and significant impact on the duration of schooling.
