

Photo-thermal spectroscopy with plasmonic and rare-earth doped(nano) materials: basic principles and applications

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20509363&lokasi=lokal>

Abstrak

This book highlights the theoretical foundations of and experimental techniques in photothermal heating and applications involving nanoscale heat generation using gold nanostructures embedded in various media. The experimental techniques presented involve a combination of nanothermometers doped with rare-earth atoms, plasmonic heaters and near-field microscopy. The theoretical foundations are based on the Maxwells and heat diffusion equations. In particular, the working principle and application of AlGaN:Er³⁺ film, Er₂O₃ nanoparticles and $\text{NaYF}_4:\text{Yb}^{3+},\text{Er}^{3+}$ nanocrystals for nanothermometry based on Er³⁺ emission are discussed. The relationship between superheated liquid and bubble formation for optically excited nanostructures and the effects of the surrounding medium and solution properties on light absorption and scattering are presented. The application of Er₂O₃ and $\text{NaYF}_4:\text{Yb}^{3+},\text{Er}^{3+}$ nanocrystals to study the temperature of optically heated gold nanoparticles is also presented. In closing, the book presents a new thermal imaging technique combining near-field microscopy and Er³⁺ photoluminescence spectroscopy to monitor the photothermal heating and steady-state sub-diffraction local temperature of optically excited gold nanostructures.
