Abstrak

In this Digital Economics era, capital market interests not only to investor to acquire profit from stock buying/selling activity but also to go public company as a cheaper financial source for business development. The excellent price of stock, stability, and accessibility make capital market become more interesting. An improvement in future national economic condition affected the growth of capital market and to anticipate this growth stock exchange has prepared Remote Trading concept.

Remote Trading is a facility that enables broker to do stock transaction directly to the stock trading system. Stock exchange abroad has been successfully implemented this advance concept. As an addition, an integration of remote trading with the Internet/Electronic Commerce will generate an advantageous result.

However, the proposal of remote trading implementation in Indonesia that was initiated by the stock exchange has gave rise to pro-contra due to its advantage and drawback. In the mean time, the stock exchange has already prepared the feasibility study, investment, consultant, and even has pointed out the tender winner for remote trading development. The soft launching for remote trading itself was planned on June 2001. Because of point of view of brokers, who is also the stockholders, the implementation of remote trading was postponed indeterminately.

This seminar is a research proposal for remote trading system that started with literature study, discussion, data collection followed by analysis and concluded in recommendation for correct remote trading implementation strategy for Indonesian capital market.
