Abstrak

We reported here a rare case of a 62 year old male patient with obstructive jaundice due to bile duct tumor. The main clinical features were yellowish eye and skin, followed by pruritus and clay-colored stool. Ultrasonography showed common bile duct dilatation and without evidence of stones. Computed Tomography Scan of upper abdomen showed a mass which were thought of head of pancreas origin. Endoscopic Retrograde Cholangio Pancreatograph revealed tight narrowing of the distal bile duct to a malignant tumor. A stent was inserted to allow biliary drainage, A surgical plan for billio digestive anastomosis was rejected by the patient and family.
