Abstrak

Perilaku caring dapat membuat sikap perawat peduli terhadap kondisi pasien dan lebih bertanggung jawab. Tujuan penelitian ini mengetahui hubungan antara perilaku caring dengan sikap perawat terhadap end of life care di satu rumah sakit di Jakarta. Desain penelitian ini adalah deskripsi. Sampel data yang diambil 115 perawat di ruang ranap, dan ruang khusus dengan metode incidental sampling. Instrumen penelitian Caring Behavior Assessment Tool (CBA) untuk menilai perilaku caring, dan terjemahan The Frommelt Attitude Toward Care of the Dying Scale (FATCOD) untuk menilai sikap perawat pada end of life. Hasil penelitian terdapat hubungan antara perilaku caring dengan sikap perawat terhadap end of life. Perilaku caring penting untuk dijadikan budaya dalam merawat setiap klien.

.....Caring behavior can make nurses care about the patient's condition and be more responsible. The purpose of this study was to determine the relationship between caring behavior and nurses' attitudes towards end-of-life care at a hospital in Jakarta. The research design is descriptive. The data sample was taken by 115 nurses in the concurrent room, and in a special room using the incidental sampling method. The research instrument is the Caring Behavior Assessment Tool (CBA) to assess caring behavior, and the translation of The Frommelt Attitude Toward Care of the Dying Scale (FATCOD) to assess nurses' attitudes towards end-of-life care. The results of the study found a relationship between caring behavior and nurses' attitudes towards end-of-life care. Caring behavior is important to become a culture in caring for each client.
