Abstrak

Skripsi ini membahas tingkat seismisitas, kerapuhan batuan, dan tingkat periode ulang gempa bumi Jawa bagian barat dengan batas koordinat $105^{\circ}1'11''$ - $106^{\circ}7'12''$ Bujur Timur dan $5^{\circ}7'50''$ - $7^{\circ}1'11''$ Lintang Selatan. Analisis pengamatan menggunakan data kejadian gempa bumi selama periode 1981-2021, kedalaman h300 km, dan magnitudo $\delta 2$. Metode yang digunakan adalah Magnitude Frequency Relation (MFR) dengan hasil nilai MC sebesar 4.8. Serta metode Maximum Likelihood dengan hasil nilai b sebesar 0.5 - 1.3 dan nilai a sebesar 3.5 – 8.0. Sedangkan nilai periode ulang gempa bumi yang didapatkan berbeda-beda tergantung besaran magnitudo pada wilayah penelitian. Pada gempa bumi dengan magnitudo $\delta = 5.0$ dan $\delta = 5.5$, secara berturut-turut memiliki kisaran periode ulang gempa sekitar 1-4 tahun dan 2-7 tahun. Beda halnya dengan gempa bumi magnitudo $\delta = 6.0$ dan $\delta = 6.5$, memiliki kisaran periode ulang gempa sekitar 4-14 tahun dan 6-16 tahun.

.....This thesis discusses the level of seismicity, rock fragility, and the rate of return period for West part of the Java's earthquake with coordinate boundaries of $105^{\circ}1'11''$ - $106^{\circ}7'12''$ East Longitude and $5^{\circ}7'50''$ - $7^{\circ}1'11''$ South Latitude. Observational analysis uses earthquake data for the period 1981-2021, depth h300 km, and magnitude $\delta 2$. The methods are used Magnitude Frequency Relation (MFR) with MC value of 4.8, also the Maximum Likelihood method with the results of a b value of 0.5 - 1.3 and a value of 3.5 – 8.0. While the value of the earthquake return period obtained varies depending on the magnitude of the study area. Earthquakes with a magnitude of $\delta = 5.0$ and $\delta = 5.5$, respectively, have an earthquake return period range of about 1-4 years and 2-7 years. Unlike the case with earthquakes of magnitude $\delta = 6.0$ and $\delta = 6.5$, they have a return period of around 4-14 years and 6-16 years.
