Abstrak

Pendidikan suami dalam pola pernikahan diduga memiliki hubungan terhadap partisipasi kerja perempuan, salah satunya adalah assortative mating, yaitu fenomena ketika perempuan menikahi laki-laki dengan pendidikan setara. Untuk mengkaji hubungan ini, digunakan data SUSENAS 2020 yang diolah dengan metode regresi logit biner. Hasilnya, perempuan dalam pola marry-up high, assortative mating mid, marry-down low, marrydown high, dan assortative-mating high memiliki kecenderungan lebih tinggi untuk bekerja dan bekerja di sektor formal daripada perempuan dalam pola assortative-mating low. Akan tetapi, hasilnya sebaliknya untuk perempuan dengan pola marry-up low.

.....The husband's education is believed to be related to female's job participation, one of which is assortative mating, a phenomenon when individuals married those with the same level of education. To examine this relationship, the study analyzed the SUSENAS 2020 data using the binary logistic regression method. The results show that females in the marriage pattern of marry-up high, assortative mating mid, marry-down low, marry-down high, and assortative-mating high tend to work and engage in formal sector work compared to female in the assortative-mating low. However, the effect is the opposite for females in the marry-up low.
