Previous research has shown that social comparison is associated with negative impacts on psychological well-being. However, other findings suggest that social comparison can also serve as a protective factor. Understanding the protective and risk factors influencing psychological well-being is crucial to supporting the psychological welfare of students. Therefore, the aim of this study is to examine the role of social comparison in the academic context on psychological well-being and to identify which dimensions most significantly affect the psychological well-being of students working on their theses. This study is quantitative research with a correlational design. It involves 152 student participants, aged between 20 and 25 years, from both public and private universities in Indonesia. The measurement tools used are the Ryff's Psychological Well-Being Scale (RPWB) and the Academic Social Comparison Scale (ASCS). The results indicate that social comparison contributes 16.1% to the psychological well-being of students. The dimensions that play the most significant role in students' psychological well-being are downward comparison and upward comparison. This study suggests that future research should further explore other factors that influence psychological well-being in higher education settings</span></p>
