Abstrak

Praktik Kerja Profesi Apoteker di PT. Ethica Industri Farmasi bertujuan untuk menelaah penerapan 5S di area produksi sehingga dapat membantu terciptanya lingkungan kerja yang tertib, teratur dan bersih serta mencegah terjadinya kontaminasi khususnya dari APD yang digunakan. Kajian dilakukan dengan menggunakan metode observasi. Pengumpulan data dilakukan berdasarkan pengamatan terhadap area *change room* produksi dan pencatatan terhadap keadaan area *change room* sebelum dilakukan optimalisasi penerapan 5S. Kemudian disusun rancangan optimalisasi penerapan 5S di area *change room* produksi berdasarkan hasil observasi. Berdasarkan hasil pengamatan ditemukan ketidakaturan penyimpanan pakaian khusus yang digunakan operator untuk memasuki area produksi. Hal ini dapat meningkatkan resiko terjadinya kontaminasi dari APD selama proses produksi, dikarenakan penyimpanan pakaian yang tidak teratur dapat menyebabkan tertukarnya pakaian antar operator dan menyebabkan terjadinya penumpukan partikel yang dapat terbawa memasuki area produksi karena *coverall* melebihi batas pemakaian. Sehingga penerapan 5S di area change room produksi farmasi dapat meminimalisir terjadinya kontaminasi dari APD khususnya *coverall* serta menciptakan lingkup kerja yang teratur.

.....

Pharmacist Professional Work Practices at PT. Pharmaceutical Industry Ethics aims to examine the implementation of 5S in production areas so that it can help create an orderly, orderly and clean work environment and prevent contamination, especially from the PPE used. The study was carried out using the observation method. Data collection was carried out based on observations of the production change room area and recording the condition of the change room area before optimizing the implementation of 5S. Then a design for optimizing the implementation of 5S in the production change room area was prepared based on the results of the observations. Based on the results of observations, irregularities in the storage of special clothing used by operators to enter the production area were found. This can increase the risk of contamination from PPE during the production process, because irregular storage of clothing can cause clothing to be exchanged between operators and cause a buildup of particles that can be carried into the production area because the coverall exceeds the usage limit. So that implementing 5S in the pharmaceutical production change room area can minimize contamination from PPE, especially coveralls and create an orderly work environment.
