Abstrak

Praktik Residensi Keperawatan Medikal Bedah peminatan muskuloskeletal ini bertujuan untuk menerapkan peran perawat sebagai pemberi asuhan, edukator, peneliti, dan innovator. Peran sebagai pemberi asuhan dilakukan dengan mengaplikasikan Model Teori Adaptasi Roy pada pasien spondilitis TB dan 30 kasus gangguan muskuloskeletal. Peran perawat sebagai edukator juga dijalankan saat memberikan sosialisasi terkait EBN dan proyek inovasi. Saat mengimplementasikan EBN berupa edukasi pre operatif, merupakan tahapan pelaksanaan perawat sebagai peneliti. Peran perawat sebagai innovator diwujudkan dalam proyek inovasi media edukasi cetak positioning technique dan bantal penopang pasien SCI saat mobilisasi. Rangkaian penerapan peran perawat tersebut merupakan upaya pembelajaran dalam mewujudkan asuhan keperawatan yang holistik untuk meningkatkan kualitas pelayanan keperawatan.

.....The residency practice in medical-surgical nursing with a specialization in musculoskeletal aims to apply the role of nurses as caregivers, educators, researchers, and innovators. The role as caregivers involves applying Roy's Adaptation Theory to patients with TB spondylitis and 30 cases of musculoskeletal disorders. Nurses also act as educators by providing orientation on Evidence-Based Nursing (EBN) and an innovation project. Implementing EBN through preoperative education constitutes the nurse's role as a researcher. The role as an innovator is exemplified by a project involving printed educational media on positioning techniques and supportive pillows for SCI patients during mobilization. This series of nursing role applications represents efforts in learning to achieve holistic nursing care and enhance nursing service quality.
