Abstrak

Sikap berperan dalam membentuk kecenderungan perilaku, termasuk kecenderungan untuk menolak atau membenarkan perundungan. Penelitian ini bertujuan untuk menguji hubungan antara fondasi moral dan sikap terhadap perundungan pada mahasiswa Generasi Z Indonesia. Partisipan penelitian berjumlah 218 dengan 69,7% mahasiswi. Alat ukur yang digunakan adalah Moral Foundations Questionnaire 2 (MFQ-2) dan Attitude toward Bullying (ATB). Hasil uji korelasi menunjukkan hubungan signifikan dan positif antara fondasi moral dengan sikap terhadap perundungan ($r = 0,195$, $p = 0,004$). Fondasi Care atau kepedulian ($r = 0,357$, $p < 0,001$) dan proporsionalitas ($r = 0,192$, $p = 0,004$) memiliki hubungan yang signifikan dan positif dengan sikap terhadap perundungan. Nilai tersebut memiliki arti bahwa semakin tinggi nilai fondasi moral seseorang, maka semakin tidak setuju mahasiswa terhadap perundungan.

.....Attitudes play a role in shaping behavioral tendencies, including the tendency to reject or justify bullying. This study aims to examine the relationship between moral foundations and attitudes toward bullying among Generation Z university students in Indonesia. A total of 218 students participated in this study, with 69.7% being female. The instruments used were the Moral Foundations Questionnaire 2 (MFQ-2) and the Attitude Toward Bullying (ATB) scale. Correlation analysis revealed a significant positive relationship between moral foundations and attitudes toward bullying ($r = 0.195$, $p = 0.004$), indicating that higher moral foundation scores are associated with greater disapproval of bullying. Specifically, the Care foundation ($r = 0.357$, $p < 0.001$) and the Proportionality foundation ($r = 0.192$, $p = 0.004$) showed significant positive correlations with attitudes toward bullying.
