## Abstrak

[Perekonomian dunia pada saat ini mengalami fenomena yang disebut sebagai global imbalance. Dengan negara-negara maju yang secara garis besar mengalami penurunan pertumbuhan, negara-negara emerging market menjadi sorotan bagi investor dan telah menguasai lebih dari setengah GDP dunia. Dengan tingkat pertumbuhan yang tinggi, timbul kekhawatiran bahwa negara-negara tersebut mengalami tingkat pertumbuhan yang berbahaya. Dengan temperatur ekonomi yang tinggi tersebut, negara-negara ini menjadi rawan terhadap tekanan eksternal, dan dikhawatirkan dapat menimbulkan dampak pada negara disekitarnya.

Penelitian ini bertujuan untuk menganalisa tekanan overheating yang dialami Indonesia. Selain itu, penelitian ini juga bertujuan sebagai sistem peringatan dini untuk krisis yang akan datang, dan menganalisa indikator-indikator yang dapat menyebabkan krisis tersebut.;

The world is currently facing a phenomenon called the global Imbalance. With developing economies facing decreasing growth, emerging markets are currently rising and occupying more than half of the worlds GDP. Accompanied by rising growth rates, numerous studies are concerned of the danger leves associated with these growths. As with high overheating pressures, a country becomes prone to external shock, and may as well create spillovers to other countries. This research is done to analyze whether Indonesia faces overheating pressures or sound economic development. This research also aims to serve as an alternative method of early warning system for overheating to the economy, as well as analyzing the indicators behind the high temperatured performance., The world is currently facing a phenomenon called the global Imbalance.
