ABSTRAK

National Health Insurance (NIH/JKN) has been enacted since January 2014. Various outcomes of geriatric patient care, such as improved functional status and quality of live have not been evaluated. Prolonged hospitalization and re-hospitalization are potentially affecting the affeciency care of this vulnerable group. This study aimed to identify the differences of functional status improvement, quality of life improvement, length of stay, and hospitalization of geatric patients admitted to CMH between prior to and after NHI implementation is favor.
